The present sequence represents a synthetic peptide which has a high affinity for glycoaminoglycans and proteoglycans. The peptide is useful in methods for modulating heparin or other glycoaminoglycans with anticoagulant activity, promoting cell attachment or adhesion to natural or synthetic surfaces (especially vein grafts), modulating tumour cell entastasis, modulating cartilage differentiation, targeting drugs to epithelial cell surfaces (or to other cells expressing proteoglycans), modulating enzymes that act on glycoaminoglycan substrates, affinity purification of bioactive sequences of a glycoaminoglycan, modifying through glycoaminoglycans, and modulating wound healing. The peptide may also be used for blocking tissue uptake of heparin or other
                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel synthetic peptides with high affinity for glycoaminoglycans and proteoglycans, useful for modulating heparin, promoting cell attachment, modulating tumor metastasis and modulating wound healing.
                                                                                               Glycoaminoglycan; proteoglycan; heparin modulation; anticoagulant; cell attachment; cell adhesion; vein graft; tumour cell metastasis; cartilage differentiation; wound healing.
                                                                 Peptide modulating activity of heparin, and other glycans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure, Page 30; 76pp, English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a synthetic peptide which has a high affinity for glycoaminoglycans and proteoglycans. The peptide is useful an methods for modulating heparin or other glycoaminoglycans with anticoagulant activity, promoting call attachment or adhesion to natural or synthetic surfaces (especially vein grafts), modulating tumour cell estatasts; modulating cartilage differentiation, targeting drugs to epithelial cell surfaces (or to other cells expressing proteoglycans), modulating enzymes that act on glycoaminoglycan substrates, affinity purification of bioactive sequences of a glycoaminoglycan, modifying endothelial cell pro-coagulant or anti-coagulant functions mediated through glycoaminoglycans, and modulating wound healing. The peptide may also be used for blocking tissue uptake of heparin or other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel synthetic peptides with high affinity for glycoaminoglycans and proteoglycans, useful for modulating heparin, promoting cell attachment, modulating tumor metastasis and modulating wound healing.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 13, Application US/08677304
Patent No. 5721212
GENERAL INFORMATION:
APPLICANT: Wakefield, Thomas W.
APPLICANT: Andrews, Philip C.
APPLICANT: Stanley, James C.
TITLE OF INVENTION: LOW MOLECULAR WEIGHT HEBARIN AND TITLE OF INVENTION: LOW MOLECULAR WEIGHT HEBARIN TITLE OF INVENTION: ANTICOAGULATION REVERSAL
                                                                                   APPLICANT: Wakefield, Thomas W.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Primary structures of the alamine-rich antifreeze polypeptides from grubby sculpin, Myoxocephalus aenaeus.";

Can. J. Zool. 66:403-408 (1988).

-!- FUNCTION: Antifreeze proteins lower the blood freezing point.

-!- SIMILARITY: Belongs to the type-I AFP family.

PIR; S07046; FDF18G.

Antifreeze protein; Direct protein sequencing; Repeat.

MOD RES

1 Blocked amino end (Met).

SEQÜENCE 40 AA; 3579 MW; 32F50EE243C2ADII CRC64;

Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.

Claim 10; Page 14; 72pp; English.

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention of escribes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides

```
invention describes polypeptides (T) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatizamer acid composition are used as molecular weight markers for glatizamer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune attentions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Gillain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, psoriasis, pempidus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, and delayed-type hypersensitivity. The groupserties which are analogous to glatizamer acetate molecules, which makes them ideal for use as molecular weight markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    4,

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer actatate invention are used as molecular weight markers for glatiramer actatate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune thyroidmune haemolytic anaemia, autoimmune thyroidmune baemolytic anaemia, autoimmune cophoritis, autoimmune thyroidmune seen of disease, chronic immune thyroidmines, graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic mysocedema, mysathenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythemacosus. Mediated mediated diseases which can be treated include host-versus-graft disease, graft-versus-host disease, and delayed-type hypersensitivity. The properties which are analogous to glatiramer acetate molecules, which are analogous to glatiramer acetate molecules, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAW24434-W24459 are nucleic acid (NA) binding peptides, capable of both condensing and stabilising a NA. The peptides can be conjugated to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid transporter; gene therapy; binding complex; lysis agent; JTS-1; K8; alpha helix; endosome; lysosome; nucleus targeting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 AKKYAKKEKAYAKKAEKAAKKAEAKAYKAAEAKKKAEAKYKAEAAKAAAKEAAYEA 56

lytic peptide to form a nucleic acid transporter system. The lysis agent forms an alpha-helical structure. The transporter system is used to deliver nucleic acid to a cell and for treating humans by gene therapy. By taking advantage of the characteristics of both the lysis agents and the binding molecules, delivery of the nucleic acid is enhanced. Specific lysis agents are capable of releasing the nucleic acid into the cellular interior from the endosome. Release is efficient without endosomal/lysosomal degradation. Once released the binding complexes help target the nucleic acid to the nucleus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       glycopeptide; mannose; mannosylated; glycosylated; mannose receptor; macrophages; monocytes; destroy; cytotoxicity; label; image; alter; macrophage processing of antigen; MHC restriction; inflammation; inflammatory diseases; macrophage secretory products; Crohn's disease; legionnaires disease; mononuclear phagocytes; HIV; AIDS; lysosomal storage diseases; Gaucher's disease, asthma; alveolar macrophages metastasis; systemic macrophages; deliver; antigenic peptides; prevent transplant rejection; organ transplantation; antitumour agents; cancer; toxins.

This compound represents a glycopeptide effective in inhibiting the binding of labelled mannosylated BSA to mannose receptors. Mannose receptors are uniquely found on macrophages and not on monocytes. Glycopeptides are uniquely found on macrophages and morocytes. Glycopeptides such as this provide a mechanism to target macrophages specifically, to image, label, destroy or otherwise alter their antigen processing function. In addition they can be conjugated to solid supports and used to purify mannose receptors from a variety of sources. They are useful in the treatment of inflammatory diseases driven by macrophage secretory products eg. Crohn's disease; infectious diseases in which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            macrophages harbour replicating infectious agents eg. Legionnaires diseases, viral infections involving mononuclear phagocytes eg. HIV and lysosomal storage diseases, in which macrophages are principally involved eg. Gaucher's disease, asthma mediated by alveolar macrophages; and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New high affinity mannose receptor ligand cpds. - for treating diseases mediated by macrophage activity e.g. asthma, inflammatory diseases and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      controlling metastasis, mediated by systemic macrophages. The peptides can also be used to deliver antigenic peptides as conjugates to a macrophage to marshal an immune response; also self peptides to prevent issue transplant rejection. ```
The present sequence is that of a peptide of potential use for production of a coded probe useful in the method of the invention. The invention provides methods, apparatus and compositions for the detection, identification and/or sequencing of bimolecules, such as nucleic acids or proteins. Coded probes comprising a probe molecule attached to one or more nano-barcodes are allowed to bind to target molecule(s). After binding and separation from unbound coded probes, the bound coded probes are allowed from unbound coded probes, the bound coded probes are allowed as surface and analysed by scanning probe microscopy (SPM). The methods allow the sequencing of long nucleic acid sequences in a single sequencing run, high speed of obtaining sequence data, low cost of sequencing and high efficiency in terms of operator time, and sensitive and accurate detection and/or identification of nucleic acids with low
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 n-protamine; anticoagulation reversal; low molecular weight heparin; polycationic; positively charged amino acid; lysine.

Protamine sulphate (also called n-protamine or salmine protamine) is a polycationic peptide derived from salmon sperm and is used to reverse heparin anticoagulation. One of the major components of salmine protamine is a 32 amino acid peptide having a total cationic charge of [+21], with arguine accounting for 67% of the total sequence and for all of the positive charge. Peptides of 20.40 amino acids with total cationic charge less than [+21] and which are able, at least partially, to reverse the offect of heparin and/or low molecular weight heparin anticoagulants are effect of heparin and/or low molecular weight heparin anticoagulants are claimed. Specifically, the peptides are polycationic analogues of n-correct protamine where the positive charge on the amino acid sequence is reduced by selective replacement of positively charged arguine residues with an uncharged residue, so that total cationic charge is less than [+21]. The can peptides are used in vivo to reverse the effects of heparin; they have the same anti-heparin activity as protamine but are less toxic (because of the reduced number of positive charges) and are relatively easy and inexpensive to prepare. The present sequence represents a specific example of a protamine-like peptide with a charge of [+18] which has been found to reverse the anticoagulation effects of both standard and low molecular weight heparin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2XXXXXXXXXXXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  determined by the number of positively charged amino acids in the sequence. Preferably the positive charges are grouped in clusters sequence. Preferably the positive charges are grouped in clusters sequence. Preferably the positive charges are grouped in clusters sequence. Preferably the positive charges are proposed in clusters amino acids having blocks of 2-4 positively charged amino acids separated by neutral acids. Alternatively the positive charge may be distributed evenly or randomly along the peptide sequence. In particular the peptides are analogues of n-protamine (total cationic charge = +21) in which selected arginine residues have been replaced by other positively charged amino acid residues have been replaced by other positively charged amino acid residues have been replaced by other positively charged amino acid residues have been replaced by other positively charged amino acid residues have been replaced by cherr positively charged amino acid residues have been replaced by the positively charged amino acid residues have been replaced by the positively contrained argumentation and the malogues of low mol. Wt. heparin (LMMH) anticoagulation and protamine since the reduced positive charge gives an improved efficiency to toxicity ratio; and they may be more effective than n-protamine in their anti-LMMH action. The present sequence (total cationic charge = 18) is a specific example of the new polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Coagulation; anticoagulant; heparin; platelet aggregation; cell adhesion; positively charged cluster; arginine; polycationic; decrease; n-protamine; salmine protamine; protamine sulphate; salmon sperm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel peptides are claimed which contain 20-40 amino acids and which have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New poly:cationic polypeptide n-protamine analogues - having reduced cationic charge and lower toxicity, used for reversing (low mol.wt.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    a total cationic charge of less than +21 (pref. +16 to +18) esp. +18) as determined by the number of positive charged amino acids in the sequence. Preferably the positive charges are grouped in clusters separated by neutral amino acids. Especially the peptides contain 28-32 amino acids having blocks of 2-4 positively charged amino acids separated by blocks of 2-6 neutral acids. Alternatively the positive charge may be distributed evenly or randomly along the peptide sequence. In particular the peptides are analogues of n-protamine (total cationic charge = +21) in which selected arginine residues have been replaced with uncharged amino acids and other arginine residues have been replaced by other positively charged amino acid residues, preferably lysine. The peptides reverse the effect of low mol. Wt. heparin (LMMH) anticoagulation and hence can be used medically to prevent bleeding after the conclusion of clinical procedures using heparin therapy. They are less toxic than n-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Coagulation; anticoagulant; heparin; platelet aggregation; cell adhesion; positively charged cluster; arginine; polycationic; decrease; n-protamine; salmine protamine; protamine sulphate; salmon sperm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel peptides are claimed which contain 20-40 amino acids and which have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      protamine since the reduced positive charge gives an improved efficiency to toxicity ratio, and they may be more effective than n-protamine in their anti-LMWH action. The present sequence (total cationic charge =
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New poly:cationic polypeptide n-protamine analogues - having reduced cationic charge and lower toxicity, used for reversing (low mol.wt.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    4;

Protamine sulphate (also called n-protamine or salmine protamine) is a polycationic peptide derived from salmon sperm and is used to reverse heparin anticosquiation. One of the major components of salmine protamine is a 32 amino acid peptide having a total cationic charge of [+21], with arginine accounting for 67% of the total sequence and for all of the arginine accounting for 67% of the total sequence and for all of the positive charge. Peptides of 20-40 amino acids with total cationic charge less than [+21] and which are able, at least partially, to reverse the effect of heparin and/or low molecular weight heparin anticoagulants are class than carried Specifically, the peptides are polycationic analogues of northannewhere the positive charge on the amino acid sequence is reduced by selective replacement of positively charged arginine residues with an uncharged residue, so that total cationic charge is less than [+21]. The numbarged residue, so that total cationic charge is less than [+21]. The have the same anti-heparin activity as protamine but are less toxic (because of the reduced number of positive charges) and are relatively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                y and inexpensive to prepare. The present sequence represents a cific example of a protamine-like peptide with a charge of [+18] which been found to reverse the anticoagulation effects of both standard low molecular weight heparin
                                                                                                                                    4. .31

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a synthetic peptide which has a high affinity for glycoaminoglycans and proteoglycans. The peptide is useful in methods for modulating heparin or other glycoaminoglycans with anticoagulant activity, promoting cell attachment or adhesion to natural or synthetic surfaces (sepcially vein grafts), modulating tumour cell metastasis, modulating cartilage differentiation, targeting drugs to epithelial cell surfaces (or to other cells expressing proteoglycans), modulating enzymes that act on glycoaminoglycan substrates, affinity purification of bioactive sequences of a glycoaminoglycan, modifying endothelial cell pro-coagulant or anti-coagulant functions mediated through glycoaminoglycans, and modulating wound healing. The peptide may also be used for blocking tissue uptake of heparin or other
                                                                                                                                                                                                  Novel synthetic peptides with high affinity for glycoaminoglycans and proteoglycans, useful for modulating heparin, promoting cell attachment, modulating tumor metastasis and modulating wound healing.

provinces meruncus, apprairation and compositions for the detection, dentification and/or sequencing of biomolecules, such as nucleic acids or proteins. Coded probes comprising a probe molecule attached to one or more nano-barcodes are allowed to bind to target molecule(s). After more nano-barcades are allowed to bind to target molecule(s). After inding and separation from unbound coded probes, the bound coded probes are aligned on a surface and analysed by scanning probe microscopy (SPM). An approach to coded probe synthesis entails creating polymer scaffolds to which nano-tag elements are attached through post-polymer assembly. For example, nano-tag elements can be attached to a peptide that has active groups (in the present case, lysine) at specific appropriately espaced sites. The peptide is then exposed to a mono-functionalised nanotag element and all of the active sites are modified. The methods allow the sequencing of long nucleic acid sequences in a single sequencing run, high speed of obtaining sequence data, low cost of sequencing and high efficiency in terms of operator time, and sensitive and accurate cated accurate cated and accurate cated c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is that of a peptide of potential use for production of a coded probe useful in the method of the invention. The invention provides methods, apparatus and compositions for the detection,
                                                                                                        Detecting, identifying and sequencing of biomolecules using controlled alignment of nano-barcodes encoding specific information for scanning probe microscopy, useful in the fields of molecular biology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        n-protamine; anticoagulation reversal; low molecular weight heparin; polycationic; positively charged amino acid; lysine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠ
                                                                                                determined by the number of positively charged amino acids in the sequence. Preferably the positively charged amino acids in the sequence. Preferably the positively charged amino acids in the sequence. Preferably the positively charged amino acids in the sequence. Preferably the positively the positive contain 28-32 amino acids having blocks of 2-4 positively charged amino acids separated by blocks of 2-6 neutral acids. Alternatively the positive charge may be distributed evenly or randomly along the peptide sequence. In particular the peptides are analogues of n-protamine (total cationic charge = +21) in which selected arguine residues have been replaced by other positively charged amino acid residues have been replaced by other positively charged amino acid residues, preferably lysine. The peptides creverse the effect of low mol. Wt. heparin (LMWH) anticoagulation and charce can be used medically to prevent bleeding after the conclusion of clinical procedures using heparin therapy. They are less toxic than n-protamine since the reduced positive charge gives an improved efficiency to toxicity ratio; and they may be more effective than n-protamine in their anti-LMMH action. The present sequence (total cationic charge = +18) is a specific example of the new polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Coagulation; anticoagulant; heparin; platelet aggregation; cell adhesion; positively charged cluster; arginine; polycationic; decrease; n-protamine; salmine protamine; protamine sulphate; salmon sperm.
                                                                                        peptides are claimed which contain 20-40 amino acids and which have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3. .23

Protamine sulphate (also called n-protamine or salmine protamine) is a polycationic peptide derived from salmon sperm and is used to reverse he anticoagulation. One of the major components of salmine protamine is a 32 amino acid peptide having a total cationic charge of [+21], with arginine accounting for 67% of the total sequence and for all of the positive charge. Peptides of 20-40 amino acids with total cationic charge less than [+21] and which are able, at least partially, to reverse the effect of heparin and/or low molecular weight heparin anticoagulants are claimed. Specifically, the peptides are polycationic analogues of n-protamine where the positive charge on the amino acid sequence is reduced by selective replacement of positively charged arginine residues with an uncharged residue, so that total cationic charge is less than [+21]. The new peptides are used in vivo to reverse the effects of heparin; they
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   have the same anti-heparin activity as protamine but are less toxic (because of the reduced number of positive charges) and are relatively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       easy and inexpensive to prepare. The present sequence represents a specific example of a protamine-like peptide with a charge of [+18] whi has been found to reverse the anticoagulation effects of both standard and low molecular weight heparin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
Peptide reversing the anticoagulant effects of heparin - is based on protamine but has fewer positive charges for reduced toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           n-protamine; anticoagulation reversal; low molecular weight heparin; polycationic; positively charged amino acid; lysine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1;

1;

cationic charge and lower toxicity, used for reversing (low mol.wt.) heparin anticoagulation.

Disclosure; Page 13; 34pp; English

Novel peptides are claimed which contain 20-40 amino acids and which have a total cationic charge of less than +21 (pref. +16 to +18; esp. +18) as determined by the number of positively charged amino acids in the sequence. Preferably the positive charges are grouped in clusters separated by neutral amino acids. Especially the peptides contain 28-32 amino acids having blocks of 2-4 positively charged amino acids separated by blocks of 2-6 neutral acids. Alternatively the positive charge may be distributed evenly or randomly along the peptide sequence. In particular the peptides are analogues of n-protamine (total cationic charge +21) in which selected arginine residues have been replaced by other positively charged amino acids and other arginine residues have been replaced by other positively charged amino acid residues, preferably lysine. The peptides amino acids and other arginine residues have been replaced by other positively charged amino acid residues, preferably lysine. The peptides chence can be used medically to prevent bleeding after the conclusion of clinical procedures using heparin therapy. They are less toxic than n-cordity ratio; and they may be more effective than n-protamine in their anti-LMMH action. The present sequence (total cationic charge = 16) is a specific example of the new polypeptides

Patent No. 5534619
GENERAL INFORMATION:
APPLICANT: Wakefield, Thomas W.
APPLICANT: Andrews, Philip C.
TITLE OF INVENTION: LOW MOLECULAR WEIGHT HEPARIN AND TITLE OF INVENTION: ANTICOAGULATION REVERSAL
NUMBER OF SEQUENCES:
ADDRESSEE: Benita J. Rohm, Esq.
COMPUTER REALDER FORM
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/993,008A
FLING DATE: 18-DEC-1997
PRIOR APPLICATION DATA:
